ELECTRONIC VARIABLE SPEED DRIVE

The 733R Reversing Speed Controller is an Electronic Variable Speed Drive for Permanent Magnet and Shunt Wound D.C. Motors up to 0.18kW. The Armature of the motor is supplied with a variable d.c. voltage which drives the motor at a given set speed. The motor back e.m.f. is monitored via a feedback network to maintain the set speed. The maximum armature voltage may be set at 100 volts or 200 volts by changing link v-v. Direction of Rotation is selected by connecting F-N for Forwards or R-N for Reverse on the Direction Control terminal block. Dynamic Braking is applied when forward or reverse is not selected. This function may be omitted.
